1. Oxygen is contained in a 0.05 m$^3$ steel tank at a pressure of 200 bar at 27 °C.
   a. What is the mass of oxygen in the tank?
   b. If the pressure in the tank gets too high, a fusible plug melts to release the pressure. At what temperature should the plug melt to keep the pressure below 250 bar?

2. An ideal gas is compressed from a volume of 0.085 m$^3$ to a volume of 0.034 m$^3$ while the pressure is increased from 100 kPa to 390 kPa. The temperature increases by 146 K during this process. The specific gas constant, R, is 0.296 kJ/kg-K.
   a. Find the temperature of the gas at the end of the process.
   b. What is the mass of gas in the tank?
   c. What is the molecular weight of the gas?

3. The equation of state for a gas is

   $$\bar{v}(P + \frac{10}{\bar{v}^2}) = \bar{R}T$$

   where $\bar{v}$ = specific molar volume (m$^3$/kmol)
   P = pressure (kPa), $\bar{R}$ = universal gas constant (kJ/kmol-K) and T = temperature (K)

   One kmol gas is expanded from 2 to 4 m$^3$ at a constant temperature of 300 K.
   a. What is the boundary work done? Boundary work, $W_b$, is calculated by:

   $$W_b = \int_{V_1}^{V_2} PdV$$

   And

   $$\bar{v} = \frac{V}{N}$$

   Where N = # moles of the gas.
4. Nitrogen, an ideal gas, is expanded in a polytropic process according to the relation:

\[ PV^n = \text{constant} \]

where \( P \) = pressure (kPa), \( V \) = volume (m\(^3\)) and \( n \) = a constant. The initial volume of the nitrogen is 2 m\(^3\); the initial pressure is 500 kPa and the initial temperature is 300 \(^\circ\)C. During the expansion, the volume triples and the pressure decreases to half its initial value.

a. Find \( n \).

b. Calculate the equilibrium temperature after expansion.

c. Calculate the boundary work by the gas during the process in kJ.

5. A device containing air is operated in a cycle consisting of four processes with no work exchanges other than boundary work.

1 \( \rightarrow \) 2: Isothermal compression, \( V_1 = 3 \text{ m}^3 \), \( V_2 = 1 \text{ m}^3 \); \( P_1 = 100 \text{ kPa} \)

2 \( \rightarrow \) 3: Isochoric heat loss, \( P_3 = \frac{P_1}{2} \text{ m}^3 \)

3 \( \rightarrow \) 4: Isobaric expansion, \( V_4 = 3 \text{ m}^3 \)

4 \( \rightarrow \) 1: Isochoric heat addition, return to state 1

a. Find \( P_2 \)

b. Find \( W_b \) for process 3 \( \rightarrow \) 4

c. Find \( W_b \) for process 1 \( \rightarrow \) 2

d. Find the net work for the cycle

e. Graph the process on the P-V diagram below
6. A rigid tank contains an ideal gas at 300 kPa and 600K. Now half the gas is withdrawn from the tank and the final pressure is 100kPa.

   a. Find the final temperature of the gas after half the mass is removed and the pressure is reduced.
   b. Compare the system to one where the final temperature is the same as in part a but no mass was removed: What is the final pressure?

7. A cylindrical piston cylinder device has three chambers, as shown below. Chamber 1 contains 1 kg helium; chamber 2 contains condensing water vapor; chamber 3 is evacuated. The device is placed in surroundings whose temperature is 200 °C and allowed to come to equilibrium. The inside diameter of chamber 1 is 10 cm and the inside diameter of chamber 2 is 4 cm. Find the volume of the helium in chamber 1 when equilibrium is reached. (Answer: 3.95 m³)
