# Aging, Shaking, and Cracking of Infrastructures

From Mechanics to Concrete Dams and Nuclear Structures

- Self-contained with ample coverage of fundamental underpinnings in the first part
- Stands as the only book detailing the advanced nonlinear analysis of concrete dams and nuclear containment structures
- Features highly inter-disciplinary coverage tying together nonlinear transient finite element analysis, concrete aging, earthquake engineering, probabilistic analysis, and machine learning
- Guided by the most up-to-date understanding from the peer-reviewed, archival literature

This self-contained book focuses on the safety assessment of existing structures subjected to multi-hazard scenarios through advanced numerical methods. Whereas the focus is on concrete dams and nuclear containment structures, the presented methodologies can also be applied to other large-scale ones. The authors explain how aging and shaking ultimately lead to cracking, and how these complexities are compounded by their random nature. Nonlinear (static and transient) finite element analysis is hence integrated with both earthquake engineering and probabilistic methods to ultimately derive capacity or fragility curves through a rigorous safety assessment. Expanding its focus beyond design aspects or the state of the practice (i.e.
